

Analytics & Business Intelligence Solutions

Fact-based decisions to streamline processes and increase revenue opportunities

A cost-effective solution to rapidly query data and build valued business reports instantly: the latest views of your operations with no need for complex IT interaction.

With ever-increasing competition, businesses require greater visibility and the ability to make more profitable decisions faster. While most organisations have invested in technology that collects data from customers and systems, vast amounts of potentially valuable data remain locked in multiple silos, with poor integration leading to problems in obtaining consistent and accurate information to support timely fact-based decision making. Verteda Agile BI solutions solve this issue – giving you more insights and putting you in control, from knowing where you can cut costs to predicting a customer's next purchase and providing the highest level of service.

- Highly cost-effective compared to traditional BI tools
- Optimised for stadia, arena, hotels, hospitality and foodservice locations
- Flexibility and extensive functionality at your fingertips
- Fast access to information and the ability to combine data from multiple sources
- Easy to use – speeding up training and orientation

The power of search – the insight of business intelligence

A next-generation business intelligence solution, Agile BI pulls data from multiple Verteda data stores and third party databases to deliver instant reporting that can be shared across your venue via web browser, tablet or smartphone.

As required, your solution can use data from your 3rd party POS, finance and labour management solutions to understand your data and linking to social media including Twitter feeds, LinkedIn and Google Analytics.

So long as your people have an Internet connection, they can access consistent and accurate information quickly and securely; you can build reports and query data instantly with no need for complex IT interaction. And because Agile BI search technology queries data directly, network overload is avoided and system performance uncompromised. Agile BI can be purchased or licensed according to your requirements, implemented onsite or provided as a hosted solution

Verteda BI: working for you

- Evidence-based decision making
- Fast and easy to deploy
- Secure information access: powerful security features
- Flexible licensing: on-premises or a hosted Software as a Service (SaaS)
- Available on mobile devices
- Simple data discovery – drill-down into the detail
- Enhanced business visibility with multiple viewing options
- Flexible reporting - visualisation includes dashboards, graphs and Venn diagrams
- Telephone hotline and remote access support

Powerful BI to streamline your business and optimise operations

Rapid deployment

We can deploy Agile BI within your environment quickly and with no disruption: installation and full system training is complete in less than one working week. Ongoing management and the creation of new reporting are simple and require little IT support. A key strength is that users can create new reporting and link data quickly and easily.

Data discovery is simple and intuitive

Agile BI is designed to support high data volumes and high query demands. The solution integrates with all major databases and data sources, and can even report on email. Once the initial installation and training is complete, you are virtually self-sufficient.

View BI using a desktop web browser or next-generation smartphones and tablets

Agile BI is a 'next generation' solution, built to run through a browser, tablet or smartphone. The application creates an environment through a user-friendly graphical interface that provides the power, flexibility and ease of use to 'mine' your data, with the ability to analyse that data in any form and in any way you wish.

Business visualisation with multiple graph types and dashboards

Agile BI comes with the usual views associated with data analysis solutions such as tabular, cross-tabs and graphs, all of which are fully interactive, allowing the user/viewer to drill down into the source data.
